Executive Summary

ADE Consulting Group Pty Ltd (ADE) was engaged by Lendlease Group (Lendlease) to assess the levels of construction related noise generated during active works on the Tweed Valley Hospital Project and associated road upgrade works located at 771 Cudgen Road, Cudgen in New South Wales (hereinafter referred to as 'the Site').

This report summarises ambient noise data collected at three (3) locations during the monitoring period of September 2023, each device being positioned along the southern alignment of Cudgen Road and located close to, or adjacent to, sensitive receptors.

At the time of preparing this report and the monitoring period which it covers (September 2023), CD Civil were onsite completing nature strip landscaping and associated activities along Cudgen Road, and Lendlease were demobilising the site compound and associated laydown areas.

Analysis of the recorded data contained within the report for this survey period shows that although infrequent, instances of measurable noise impacts during works to residential and commercial noise sensitive receivers located along Cudgen Road.

This report finds the following:

- Noise levels and associated exceedances have shown a sharp decrease in frequency from previous monitoring periods.
- The degree of impact (i.e., exceedance amount) remains somewhat consistent, up to 10 to 12 dB above the noise management level for standard hours but averaging approximately 3-4 dB overall.
- Impact duration was found to be typically no greater than 1 hour per day as identified in this report (some exceptions apply).
- During standard hours, the Highly Noise Affected criterion is not exceeded.

The recommendations outlined below are strongly encouraged as construction works come to a close during October 22023:

- As part of continued community consultation, particularly leading into works with potential high noise output or leading into nightworks, community consultation via Letterbox drops to all surrounding sensitive land uses (including the TAFE), is recommended.
- Implement the range of mitigation and management practices and strategies detailed in the CNVMP, where feasible and reasonable (e.g., for work durations in a single location of more than 1 hour), to lower the impact of the works.

1 Introduction

1.1 Introduction

ADE Consulting Group Pty Ltd (ADE) was engaged by the Lendlease Group (Lendlease) to assess the levels of construction related noise during the construction of the Tweed Valley Hospital Project and associated road upgrade works. The project site is located at 771 Cudgen Road, Cudgen in New South Wales (hereinafter referred to as 'the Site').

At the time of preparing this report and the monitoring period which it covers (September 2023), CD Civil were onsite completing nature strip landscaping and associated activities along Cudgen Road, and Lendlease were demobilising the site compound and associated laydown areas.

The purpose of environmental monitoring is to:

- Assess construction related airborne noise levels with regulatory requirements, development consent conditions, Australian guidelines, and international standards for construction noise management and control on construction sites that are applied to the Tweed Valley Hospital project.
- Mitigate potentially excessive noise generation through site planning and the adoption of appropriate work methods and practices where feasible and reasonable.
- Monitor and assess construction impacts likely to cause annoyance to the amenity on surrounding sensitive receivers and provide feasible and reasonable recommendations to manage the impacts identified.
- Proactively establish and maintain positive relationships with project stakeholders.

The purpose of the Environmental Noise Monitoring Assessment (ENM) report is to assess the potential impacts that construction activities from the Tweed Valley Hospital Project have on ambient noise levels on Site and assess compliance with the Tweed Valley Hospital Management Plan – Noise and Vibration.

This assessment allows for feasible and reasonable mitigation and management measures as far as practicable to be adopted for works aligned with the conditions C4 - C7, C12 - C17 and C17 - C17 and C

This report uses specific terminology and to address this for the reader, a general acoustic glossary is provided in **Appendix I – Glossary**.

1.2 Project background

On 13 June 2017, the NSW Government announced an allocation of approximately \$534M for the development of a new hospital on a greenfield site in the Tweed Valley area. The site of the new Tweed Valley Hospital (the Project) is located at 771 Cudgen Road, Cudgen in New South Wales.

An Environmental Impact Statement (EIS) was prepared to accompany a State Significant Development Application for the Project which was assessed under Part 4 of the *Environmental Planning and Assessment Act 1979* (EP&A Act).

An overview of the project specific information is provided in **Table 1** below.

Table 1Project Specific Information

Site Details	
Client Name:	Lendlease
ADE Project Number:	A101021.0286.00
Site Address:	771 Cudgen Road, Cudgen NSW (Lot 11 DP 1246853)
Date of Report:	14/08/2023
Development Consent	SSD-10353, Health Administration Corporation. Authorised by the Minister for Planning and Public Spaces on 9 March 2020. Consent approved on 12 June 2020.
Objectives:	 comply with relevant guidelines and conditions C4 – C7, C12 – C14 and B16 of the SSD-10353 consent manage potential airborne construction noise impacts from construction activities which have the potential to affect the nearby noise sensitive receivers (Kingscliff TAFE and residential properties) establish and maintain good relationships with the neighbours and wider community.
Key Legislation:	Protection of the Environment Operations Act 1997 (NSW) (POEO Act). The POEO Act is a key piece of environmental protection legislation and regulates activities via: environmental protection licensing, as per schedule 1 regulation of scheduled and non-scheduled activities environmental protection offences and penalties establishment of a general duty of care to notify environment harm.

1.2.1 Development consent SSD-10353

The consent of approval conditions regarding noise are summarised below in Table 2.

 Table 2
 Development consent conditions

Table 2 Development consent conditions								
Cond Appi Num		Condition requirements						
	C4	Construction, including the delivery of materials to and from the site, may only be carried out between the following hours: (a) Between 7 am and 6 pm, Mondays to Fridays inclusive; and (b) Between 8 am and 1 pm, Saturdays No work may be carried out on Sundays or public holidays.						
Construction Hours	C5	Construction activities may be undertaken outside of the hours in condition C4 if required: (a) By the Police or a public authority for the delivery of vehicles, plant or materials; or (b) In an emergency to avoid the loss of life, damage to property or to prevent environmental harm; or (c) Where the works are inaudible at the nearest sensitive receivers; (d) Where a variation is approved in advance in writing by the Planning Secretary or his nominee if appropriate justification is provided for the works; or (e) For the delivery, set-up and removal of construction cranes, where notice of the crane related works is provided to the Planning Secretary and affected residents at least seven days prior to the works.						
	C6	Notification of such construction activities as referenced in condition C5 must be given to affected residents before undertaking the activities or as soon as is practical afterwards.						
	C7	The construction hours must include respite periods and specific times for activities during the day (outside the sensitive times), as required by condition B16 of this consent, for the high noise generating construction activities (such as activities that would reach or exceed the Highly Affected Noise Level as defined in the ICNG).						
	C12	The development (including roadworks) must be constructed to achieve the project specific construction NMLs detailed in the Noise and Vibration Impact Assessment for SSDA Tweed Valley Hospital Stage 2' by JHA dated 19/09/2019. Additional mitigation measures must be implemented and any activities that are likely to exceed the NMLs or the high affected noise level of 75dB(A) in accordance with the management and mitigation measures in Appendix 3 and the approved CNVMSP required by condition B16 .						
s	C13	Any noise generated during construction of the development must not be offensive noise within the meaning of the Protection of the Environment Operations Act 1997 or exceed approved noise limits for the site.						
n Noise Limits	C14	Unattended long-term construction noise monitoring must be undertaken during the duration of the Stage 2 works, consistent with the Stage 1 works in SSD-9575. The location of the loggers and the details of the monitoring methods including the reporting methods should be consistent with the CNVMSP in condition B16 and the Stage 1 works in SSD-9575.						
Construction	C15	The intra-day respite periods required to be provided in the CNVMSP in condition B16 of this development consent must be reviewed on a monthly basis, after the commencement of Stage 2 construction works, in consultation with Kingscliff TAFE and Kingscliff High School. The respite periods are to be maintained / or amended, as agreed with the identified noise receivers. The details of any amendments to the intra-day respite periods due to agreement with the Kingscliff TAFE and Kingscliff High School, must be provided to the Department for information.						
	C16	The Applicant must ensure construction vehicles (including concrete agitator trucks) do not arrive at the site or surrounding streets outside of the construction hours of work outlined under condition C4 .						
	C17	The Applicant must implement, where practicable and without compromising the safety of construction staff or members of the public, the use of 'quackers' to ensure noise impacts on surrounding noise sensitive receivers are minimised.						

Note: CoA **B16** refers to the Lendlease's Construction Noise and Vibration Management Sub-Plan (CNVMSP)

1.2.2 Monitoring Locations

Prior to the commencement of roadworks, and in response to the schedule of works at that time, unattended noise monitoring equipment was relocated on 17 November 2022 along the southern alignment of Cudgen Road at three designated locations.

These monitoring locations were established to assess the potential noise impacts to the nearest sensitive receivers with respect to the current active works and to ensure the roadworks controls are compliant with the requirements and conditions set out in the Tweed Valley Hospital Management Plan – Noise and Vibration.

All monitoring locations are within close proximity to the boundary of the nearest sensitive receivers (residential and commercial) that may be impacted by noise generated from the current roadworks and associated plant.

Aerial imaging and monitoring locations overview is presented in Appendix II - Aerial.

2 Noise criteria

2.1 NSW Interim Construction Noise Guideline

The standard construction hours are defined in the *Interim Construction Noise Guideline* (ICNG, DECC 2009) as:

- Monday to Friday 07:00 hrs to 18:00 hrs
- Saturday 08:00 hrs to 13:00 hrs
- No work on Sundays or Public Holidays.

Table 3 below provides guidance noise management levels (NML) for residential premises for airborne construction noise, reproduced from the ICNG.

Table 3 Guideline noise levels for residential premises, airborne construction noise (ICNG)

Time of Day	Noise Management Level	How to apply				
	dBA Leq,15min					
Standard hours Monday to Friday 7:00 am to 6:00 pm Saturday	Noise Affected RBL + 10 dB	The noise affected level represents the point above which there may be some community reaction to noise • where the predicted (or measured LAeq(15 minute) is greater than the noise affect level, the proponent should apply all feasible and				
8:00 am to 1:00 pm		reasonable work practices to meet the noise affected level				
No work on Sundays or Public Holidays		 the proponent should also inform all potentially impacted residents of the nature of works to be carried out, the expected noise levels and duration, as well as contact details 				
	Highly Noise Affected >75 dBA	The highly noise affected level represents the point above which there may be a strong community reaction to noise				
		 where noise is above the level, the relevant authority (consent, determining or regulatory) may require respite periods by restricting the hours that the very noisy activities can occur, taking into account: 				
		 times identified by the community when they are less sensitive to noise (such as before and after school for works near schools, or mid-morning or mid-afternoon for works near residences 				
		 If the community is prepared to accept a longer period of construction in exchange for restrictions on construction times 				
Outside recommended standard hours	Noise affected RBL + 5 dB	 a strong justification would typically be required for works outside the recommended standard hours 				
		 the proponent should apply all feasible and reasonable work practices to meet the noise affected level 				
		 where all feasible and reasonable practices have been applied and noise is more than 5 dBA above the noise affected level, the proponent should negotiate with the community 				

Note: RBL refers to Rating Background Level, as defined in the Noise Policy for Industry (EPA, 2017) and outlined in the Management Plan

2.2 Other sensitive land uses and commercial receivers

There are several sensitive land uses including residential properties and commercial receivers identified within the chainage of Cudgen Road where roadworks is currently being undertaken. These include:

- Mate and Matt's Farm Fresh Fruit and Vegetable (approximately 10 m south/south-east)
- Hardy Electrical and Solar (approximately 10 m south/south-east)
- Kingscliff TAFE (an educational facility approximately 10 m south/south-east)
- Kingscliff Library (approximately 380 m north-east)
- Tweed Regional Aquatic Centre (approximately 130 m east)
- Kingscliff High School (approximately 500 m south/south-east)
- Jack Julius Park passive recreational area (approximately 650 m south-east).

Table 4 below outlines the noise management levels for non-residential land use.

Table 4 Noise at sensitive land uses (other than residences)

Land use	Management Level LAeq,15 minute (applicable when properties are in use)
Industrial premises	External noise level 75 dBA
Office, retail outlets and other commercial properties	External noise level 70 dBA
Classrooms at school and other educational institutions	Internal noise level 45 dBA
Active recreation areas (characterised by sporting activities and activities which generate their own noise or focus for participants, making them less sensitive to external noise intrusion)	External noise level 65 dBA
Passive recreation areas (characterised by contemplative activities that generate little noise and where benefits are compromised by external noise intrusion, for example, reading, meditation)	External noise level 60 dBA
Community centres	Refer to the recommended 'maximum' internal levels outlined in AS2107 for specific uses

Note:

The internal noise level criteria shown above is adjusted by +10 dB to conservatively assume internal to external noise level differences. This is representative of windows being opened to provide ventilation.

Office, retail and other commercial properties external noise level applies to all local business premises along Cudgen Road including Mate and Matt's, and Hardy Electrical and Solar.

Other sensitive receptors not defined in the ICNG require noise level criteria to be derived from Australian Standard AS2107:2016.

The AS2107 noise level criteria are generally provided as internal levels, and an internal-to-external correction of +10 dB has been applied to assume a conservative noise level with a setting of an open window for ventilation to discern potential impact to a sensitive receiver.

The public library to the north-east would have an external noise management level of 55 dBA, this is provided in **Table 5** below.

Table 5NMLs for 'Other Sensitive Receivers' based on AS2107

	Noise Management Level LAeq,15min				
Land use	Internal	External			
Public Library	45 dBA	55 dBA			

Note: The Noise and Vibration Impact Statement was prepared under AS2107:2000. This standard has been superseded by AS2107:2018

2.3 Residential noise criteria summary

The measured background noise levels are used to determine the noise management level (NML) for the Project.

These NMLs are summarised below in Table 6.

Table 6 Noise Management Level (dB LAeq,15min) for residential receivers

NCA	Logger ID ¹	Standard hours (RBL +10)	Out of hours	Sleep Disturbance		
		Day	Day	Evening	Night	(RBL +15) dB LAMax
NCA-A/1	n/a	55	50	48	43	53
NCA-B/2	005, 006, 007	57	52	44	41	52
NCA-C/3	n/a	59	54	48	39	52

Note: Cudgen Road Upgrade Works currently operate within OOH periods

Note: All loggers are currently positioned within NCA-B/2

Note 1: Logger ID based on Acoustic Studio Report. ADE CNVIS naming convention reverts to numerical, NCA corresponds to NCA definitions outlined

in both the Management Plan and the ADE CNVIS

3 Results overview

3.1 Survey instrumentation and methodology

This monitoring report covers the monitoring period of the whole calendar month of September 2023. Unattended noise monitoring was operated at three (3) locations using Class 1 four-channel Svantek SVAN 958AG Sound & Vibration Analysers.

The monitors are enclosed in a weather resistant environmental case which is placed on the ground and covered with a tarp to aid in keeping temperatures below 60°C preventing temperature related failures, and moisture intrusion. Images relating to the installation of the loggers are provided in **Appendix II – Aerial** and **Appendix IV – Site Photographs**.

A summary of the noise and vibration monitoring equipment is provided in **Table 7** below.

 Table 7
 Noise and Vibration equipment deployed

Make	Model Serial Number		Location	Calibrated on	Calibration Due		
Svantek	SVAN958AG	98323	005	12/10/2022	12/10/2024		
Svantek	SVAN958AG	92835	006	18/02/2022	18/02/2024		
Svantek	SVAN958AG		007	09/03/2022	9/03/2024		

The noise monitoring equipment continuously measures the ambient noise environment's A-weighted Sound Pressure Level in 15-minute intervals during the daytime, evening, and night-time periods throughout the monitoring period. All equipment carries current National Association of Testing Authorities (NATA) calibration certificates, and the calibration is checked once per month to ensure calibration drift does not exceed ± 1 dB.

The height of the microphone is no less than 1.2 m, and no greater than 1.5 m above ground level. A compliant wind shield is placed on each microphone to reduce any wind interference during the measurements.

3.1.1 Analysis methodology

The three environmental noise and vibration loggers are located in relatively close proximity to each other. Legitimate construction noise impacts (such as the operation of graders, excavators, vibratory rollers, water/loaded trucks etc) would be measurable at all three loggers with varying noise levels, identified through graphical analysis.

Noise data exceeding the general ambient noise environment (dominated by road traffic noise) are investigated further to determine whether site impact may be present, or extraneous noise data is the dominant source of the alert.

Additional verification is undertaken and the event is disregarded if it cannot be demonstrated that the event occurred as a result of activities conducted on the Site or within the road corridor where roadworks are underway.

Vibration impacts that are also recorded at these locations can be correlated with measured noise impacts particularly where large/heavy plant equipment are in use near the logging devices. Higher than anticipated noise levels and increased vibration energy provides correlative data where plant such as rollers, heavy loaded trucks, graders, piling, excavating, or other vibration intensive plant equipment are within perceptible distances from the devices or sensitive receivers.

The correlation strengthens the confidence in monitoring works impacting the devices and nearby receivers, decreasing erroneous reporting of traffic noise/extraneous noise as site impact.

Weather data is collected from the Australian Weather Station located in Coolangatta (ID 040717) and the measured noise data is correlated with recorded weather conditions which exhibited fair conditions with some days of average wind conditions and precipitation resulting in 24 partial days to be removed from analysis in line with acceptable analysis and reporting exclusion requirements set out in the NPfI and AS1055.

3.2 Results

Processed noise monitoring data demonstrates that the ambient noise environment is dominated by road traffic noise compounded by fauna and insect activity.

The data has also shown that construction activities during all phases of the roadworks have had the potential to exceed the lower noise limit at the adjacent sensitive receiver as these works have moved closer to the logger locations as elements of the works progressed.

Table 8 below presents the overall unattended measurement results during the survey period at each of the three locations. Daily noise graphs are presented in **Appendix V – Noise Graphs**.

Table 8 Unattended noise monitoring results (overall – September 2023)

Logger	Measured noise levels, dBA												
	Average noise level (Leq)		L10,ave noise level		Background noise levels (RBL)		RNP defined noise level (Leq) A						
ID				Davi		NO de la			Night	Day		Night	
	Day	Eve	Night	Day	Eve	Night	Day	Eve		15 hr	1 hr	9 hr	1 hr
L.005	57	53	49	61	56	50	47	40	39	58	57	51	52
L.006	58	55	49	62	58	50	46	40	38	59	57	52	54
L.007	57	53	48	60	56	49	46	40	36	57	55	53	50

Note A: The EPA document Road Noise Policy (RNP, 2011) is used to provide road traffic noise levels for the 15-hour day and 9 hour night-time period, and the busiest daytime/night-time 1-hour. These levels are for historical correlation purposes

The results of the unattended monitoring in September show the noise intensive works undertaken at both the hospital premises and the road works along Cudgen Road has decreased in operational frequency when compared to recent previous monthly results obtained.

3.2.1 Location 5

At L005 there were a total of 216 measurements recorded with results above 57 dB(A) during construction hours (7:00AM to 6:00PM (note weekends have not been filtered out)), of which 94 were recorded outside peak traffic hours (7:00AM to 9:00AM and 3:00PM to 6:00PM, i.e., recorded between 9:00AM and 3:00PM).

Of these, twenty-two (22) were recorded as greater than 60 dB(A) (that is + 2dB above the noise management level and therefore a likely perceptible difference) on nine (9) separate days. Excluding singular measurements recorded only once during a day (i.e., noise 'peaks' considered extraneous as they are not sustained/intermittent as one would expect with construction activities), the following potential noise impacts are summarised:

- Monday 4 September 2023 Logger L.005 measured potential site impact between 62 dB(A) and 69 dB(A) LAeq 15min between 9:00AM to 10:00AM.
- Tuesday 14 September 2023 Logger L.005 measured potential site impact between 65 dB(A) and
 67 dB(A) LAeq 15min between 9:00AM to 9:45AM.

- Thursday 16 September 2023 Logger L.005 measured potential site impact between 62 dB(A) and 68 dB(A) LAeq 15min between 9:00AM to 9:45AM, and 61 dB(A) and 66 dB(A) at approximately 12:15 PM and 2:15PM respectively.
- Tuesday 28 September 2023 Logger L.005 measured potential site impact between 61 dB(A) and 65 dB(A) LAeq 15min between 12:45PM to 1:15PM, and 61 dB(A) at approximately 2:45PM.
- Wednesday 29 September 2023 Logger L.005 measured potential site impact of 61 dB(A) at approximately 9:15AM and 10:00AM.

Figure 1 below presents noise and vibration data processed from logger L.005. It displays measured Leq noise levels exceeding 57 dBA (to filter out low ambient noise below the nominated NML) and are inclusive of all road traffic noise along Cudgen Road, weather affected noise data has been removed.

A correlation between elevated PPV measurements was found to be evident with the most of the above twenty two (22) measurements, and when considering the timing of the noted potential impacts suggests noise and vibrational energy attributed to early start works (likely trades/completion works) which would be in close proximity to the logger, or utilisation of the main hospital premises access point.

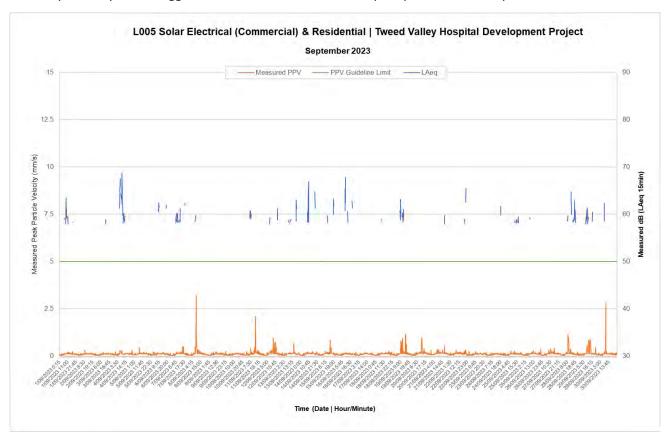

Figure 1 Measured PPV Vibration and Leq noise levels – Location 005

3.2.2 Location 6

At L006 there were a total of 308 measurements recorded with results above 57 dB(A) during construction hours (7:00AM to 6:00PM (note weekends have not been filtered out)), of which 109 were recorded outside peak traffic hours (7:00AM to 9:00AM and 3:00PM to 6:00PM, i.e., recorded between 9:00AM and 3:00PM).

Of these, twenty-five (25) were recorded as greater than 60 dB(A) (that is + 2dB above the noise management level and therefore a likely perceptible difference) on eight (8) separate days. Excluding singular measurements recorded only once during a day, likely to be extraneous measurements, the following potential noise impacts are summarised:

- Friday 1 September 2023 Logger L006 measured potential site impact between 61 dB(A) and 62 dB(A) LAeq 15min between 9:00AM to 9:15AM.
- Monday 4 September 2023 Logger L006 measured potential site impact between 61 dB(A) and 66 dB(A) LAeq 15min between 9:15AM to 11:45AM, and 61 dB(A) between 12:00PM and 12:45 PM.
- Tuesday 28 September 2023 Logger L006 measured potential site impact between 64 dB(A) and 66 dB(A) LAeq 15min between 12:45PM to 2:45PM.

Figure 2 below presents correlation data at Monitoring Location L.006.

As noted in previous reporting, vibration energy is higher than L.005 and L.007 due to proximity to an adjacent field and other commercial works. No correlative data of any significance is assessed.

At least some noise measurements recorded at this location are associated with the operation of the adjacent commercial premises, as the logger is positioned near the car park of the business and would frequently be measuring activity of customers, as well as the operation of the business.

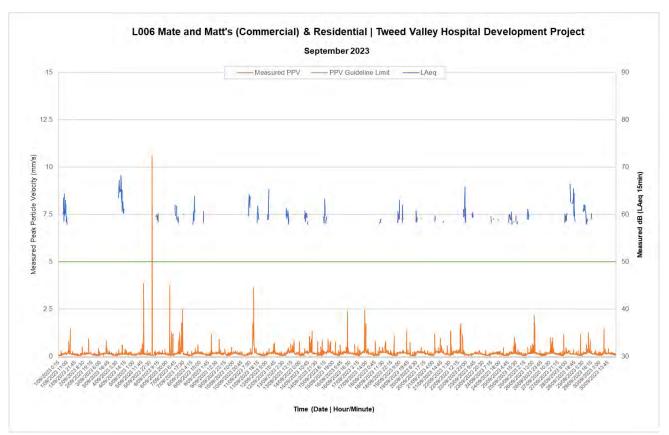

Figure 2 Measured PPV Vibration and Leq noise levels – Location 006

3.2.3 Location 7

At L007 there were a total of 120 measurements recorded with results above 57 dB(A) during construction hours (7:00AM to 6:00PM (note weekends have not been filtered out)), of which 21 were recorded outside peak traffic hours (7:00AM to 9:00AM and 3:00PM to 6:00PM, i.e., recorded between 9:00AM and 3:00PM).

Of these, nine (9) were recorded as greater than 60 dB(A) (that is + 2dB above the noise management level and therefore a likely perceptible difference) on five (5) separate days. Excluding singular measurements recorded only once during a day (i.e., noise 'peaks' considered extraneous as they are not sustained/intermittent as one would expect with construction activities), the following potential noise impacts are summarised:

- Friday 1 September 2023 Logger L007 measured potential site impact of 61 dB(A) LAeq 15min between 10:00AM to 10:15AM.
- Tuesday 28 September 2023 Logger L007 measured potential site impact between 60 dB(A) and
 63 dB(A) LAeq 15min between 12:45PM to 1:15PM and 60 dB(A) at approximately 2:45PM.

Figure 3 which follows presents correlation noise and vibration data at Monitoring Location L.007.

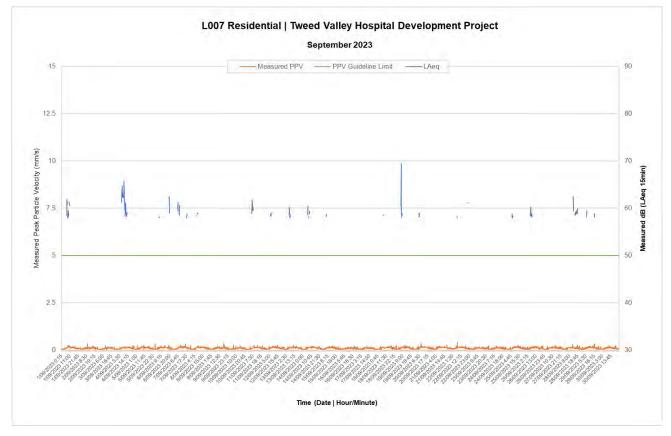

Figure 3 Measured PPV Vibration and Leq noise levels – Location 007

3.3 Discussion

Analysis of the processed noise and vibration data shows that noise impacts have steadily decreased as construction and roadworks progress to completion. At the time of preparing this report and the monitoring period which it covers (September 2023), CD Civil were onsite completing nature strip landscaping and associated activities along Cudgen Road, and Lendlease were demobilising the site compound and associated laydown areas.

The impacts noted in this report (ENM50) describes finishing works; potential noise impacts attributed to construction activity, whilst up to 69 dBA Leq, are infrequent in duration (experienced on a handful of days) and only temporary (typically no longer than 1 hour in total duration). This, like recent previous results, indicates works are not operating in one area, rather intermittently along the alignment in sections.

There is some minor correlation between each of the three loggers regarding noise levels and time periods of potential impact. This is notable on the morning of Monday 4 September 2023 and 28 September 2023. The small cluster of elevated measurements across all three locations recorded on Monday 4 September 220223 is however attributed to wet roads and resulting tyre noise given approximal 20mm of rain had fallen in the preceding hour prior to 9:00AM on this date.

Site specific mitigation measures remain necessary for the final stages of the project, including the continuation of letterbox drops and community notification. However, continued implementation of some mitigation measures may not be considered reasonable for works occurring in short durations (<1 hour).

4 Conclusion

ADE was commissioned by Lendlease to assess the levels of construction related noise during active works on the Tweed Valley Hospital Development Project, located at 771 Cudgen Road, Cudgen in New South Wales.

This report summarises the analysed ambient noise data collected at three locations throughout September 2023, positioned along the south and southwest alignment of Cudgen Road. At the time of preparing this report and the monitoring period which it covers, CD Civil were onsite completing nature strip landscaping and associated activities along Cudgen Road, and Lendlease were demobilising the site compound and associated laydown areas.

Noise Management Level exceedances (exclusive of existing traffic noise) have been identified with works and plant associated with construction activity for the Cudgen Road and intersection upgrade. In summary:

- Noise levels and associated exceedances have shown a sharp decrease in frequency from previous monitoring periods.
- The degree of impact (i.e., exceedance amount) remains somewhat consistent, up to 10 to 12 dB above the noise management level for standard hours but averaging approximately 3-4 dB overall.
- Impact duration was found to be typically no greater than 1 hour per day as identified in this report (some exceptions apply).
- During standard hours, the Highly Noise Affected criterion is not exceeded.

The recommendations outlined below are strongly encouraged as construction works come to a close during October 2023:

- As part of continued community consultation, particularly leading into works with potential high noise output or leading into nightworks, community consultation via Letterbox drops to all surrounding sensitive land uses (including the TAFE), is recommended.
- Implement the range of mitigation and management practices and strategies detailed in the CNVMP, where feasible and reasonable (e.g., for work durations in a single location of more than 1 hour), to lower the impact of the works.

Appendix I – Glossary

1 Sound Pressure Level

Defined as:

$$L_p = 10log_{10} \left(\frac{p^2}{p_{ref}^2} \right) dB$$

In the above equation, p is the sound pressure fluctuation relative to atmospheric pressure, and *pref* is 20 microPascals $(2 \times 10-5 \text{ Pa})$, the approximate threshold of hearing.

Sound or noise is the sensation produced at the ear by small fluctuations in atmospheric pressure. Human ears are sensitive to changes to sound pressure over a wide range, from 20 microPascals to 60 Pascals, in lieu of using a linear scale to represent this range, a logarithmic scale is adopted to better handle

2 Sound Power Level

Sound power level cannot be directly measured using a microphone, it does not change with distance and is not influenced by atmospheric conditions. The sound power level refers to the total energy of the sound, and is reference to 1 Pico Watt.

3 Weighting and Loudness

The overall level of a sound is usually expressed as dB(A) and not dB. Weighting refers to the human ear's frequency response to sound. Typically, sound is measured with an A-weighted filter which reduces the significance of lower frequencies and very high frequencies, increasing the importance of mid-frequencies (500 Hz to 4 kHz), and being a good measure of the "loudness" of a sound.

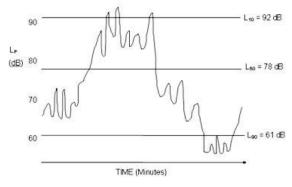

A change of 1 to 2 dB(A) is difficult to detect, whilst a change of 3 to 5 dB(A) corresponds to a small but noticeable change. A 10 dB(A) change corresponds to a doubling or halving in apparent loudness.

4 Noise Metrics and Statistical Noise Levels

- i) Laeq The time averaged A-weighted sound pressure level for the interval, as defined in AS1055.1. It is generally described as the equivalent continuous A-weighted sound pressure level that has the same mean square pressure level as a sound that varies over time. It can be considered as the average sound pressure level over the measurement period.
- LAmin/LAmax Minimum or Maximum A-weighted noise level detected during the measuring period.
 It refers to the minimum background noise detected or the maximum Lp measured.
- iii) Lago A-weighted noise level which is exceeded for90% of the measuring period. It is usually used as

the descriptor for background noise level during the measurement period.

- iv) La1 Noise level which is exceeded for 1% of the measurement period.
- v) La10 Noise level which is exceeded for 10% of the measurement period. The La10 is often referred to as the average *maximum* noise level.

5 Background Noise

The underlying level of noise present in the ambient noise, excluding the noise source which is under investigation, when extraneous noise is removed.

6 Ambient Noise

Ambient noise of an environment: the all-encompassing sound associated with that environment, being a composite of sounds from many sources.

7 Vibration

The mechanical oscillations occurring about an equilibrium point. The oscillations may be periodic such as the motion of a pendulum or random. Vibration is most commonly expressed in terms of displacement, velocity, acceleration and frequency, all of which are related

8 Velocity

The rate of change of displacement, is a vector quantity. (Fatigue indicator).

9 Acceleration

The rate of change of velocity, is a vector quantity. (Indicator of force).

10 Frequency

The number of times a periodic function or vibration occurs or repeats itself in a specified time, often 1 second – cycles per second. Frequency is measured in Hertz.

11 Hert

The unit of frequency or pitch of a sound. One hertz equals one cycle per second.

12 Peak Particle Velocity (PPV)

The greatest instantaneous particle velocity during a given time interval if measurements are made in 3-axis. The resultant Peak Particle Velocity (PPV) is the vector sum i.e. the square root of the summed squares of the maximum velocities, regardless of when in the time history those occur.

13 Root Mean Square rms

The rms value of a set of numbers is the square root of the average of their squares. Best used when assessing building damage.

14 Vibration Dose Value VDV

The Vibration Dose Value (VDV) is used for assessing intermittent vibration. A cumulative measurement of the vibration level received over an 8-hour or 16-hour period. Best used when the structure is occupied.

15 Logarithmic Scale

Comparing frequency with large amplitude differences be accomplished using a logarithmic scale. Critical vibration components usually occur at low amplitudes compared to the rotational frequency vibration. These components are not revealed on a linear amplitude scale because low amplitudes are compressed at the bottom of the scale, however a logarithmic scale shows prominent vibration components equally well at any amplitude.

16 Accelerometer

A vibration sensor whose electrical output is directly proportional to the acceleration component of the vibration. The two most common accelerometer types are the traditional charge type and the IEPE, integrated electronic piezoelectric type with a built-in line-drive amplifier to enable the output signal to be transmitted over 'longer cable runs'.

17 Geophone

Geophones measure velocity by means of a magnetic core surrounded by an electrical coil. When the surface vibrates, the geophone housing moves however the coil stays stationary, thus the movement of the magnet in the coil causes an electrical current which is calibrated to velocity of vibration.

18 Short-term vibration

Vibration which does not occur often enough to cause structural fatigue, and which does not produce resonance in the structure being evaluated.

19 Long-term vibration

All types of vibration not covered by the definition of 'short-term vibration

20 Impulsive vibration

Rapid build-up to a peak followed by a damped decay that may or may not involve several cycles of vibration. It can also consist of a sudden application of several cycles at approximately the same amplitude, providing that the duration is short (typically <2 seconds). Impulsive vibration (no more than 3 occurrences) in an assessment period is

assessed on the basis of weighted rms acceleration, and peak particle velocity.

21 Continuous vibration

Continuous vibration continues uninterrupted for a defined period (usually throughout daytime and/or night-time). This type of vibration is assessed on the basis of weighted rms acceleration.

22 Intermittent vibration

Defined as interrupted periods of continuous (e.g., a drill) or repeated periods of impulsive vibration (e.g., a pile driver), or continuous vibration that varies significantly in magnitude. It may originate from impulse sources (e.g., pile drivers and forging presses) or repetitive sources (e.g. pavement breakers), or sources which operate intermittently, but which would produce Continuous vibration if operated continuously (for example, intermittent machinery, railway trains and traffic passing by). This type of vibration is assessed on the basis of vibration dose value.

Appendix II – Aerial Imaging

ADE Monitoring locations, site location (including CD Civil's Cudgen Road Upgrade works) are presented below.
